BLE Consumption

It's not straightforward to predict the exact BLE power consumption due to the several parameter depending on. BLE consumption depends on:

- Chipset/radio
- BLE Stack + version
- BLE parameters
- Firmware efficiency

<u>Current Consumption Draw during a cycle</u>

Awaking Mode Consumption

We can define the overall energy consumption during an awaking mode as the sum of each different energy consumption state: E_awake= E_wake-up+ E_rx+ E_tx+ E_processing+ E_IFS

- Wake-up energy
- RX energy (mainly depends on the data number to receive)
- IFS energy
- TX energy (mainly depends on the data to send and the transmit power used)
- Post-processing energy (mainly depends on the application running)

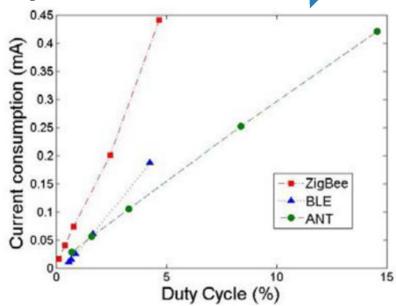

Phase	Power draw $(V_{DD} = 3V)$	Duration
1. wakeup & pre-processing	$P_{wu} = 15 \text{mW}$	$D_{wu} = 1$ ms
2. RX	$P_{rx} = 66 \text{mW}$	$D_{rx} = 8\mu \text{s/B}$
3. IFS	$P_{ifs} = 45 \text{mW}$	$D_{ifs} = 150\mu s$
4. TX	$P_{tx} = 84 \text{mW}$	$D_{tx} = 8\mu \text{s/B}$
5. post-processing	$P_{mcu} = 24\text{mW}$	$D_{mcu} = 1.4$ ms

Sleeping Mode Consumption

*))

Sleeping mode is useful for saving energy when the BLE device didn't send any data. In order to save energy, consumption is very low (2 μ W) in this mode, an engineer which is looking to increase a BLE device autonomy, will handle to reduce the duty cycle.

Overall BLE consumption in cycling mode: E_ble = E_awake + E_Sleep

Mean current consumption related to the duty cycle

BLE modele de securité

Pairing: 1

Processus de création de clés partagées / sécurité temporaire / connexion cryptée .

Bonding: 2

Stockage de la clé créée lors du couplage pour une utilisation ultérieure.

Responder Established LL connection (Optional) Security_Request Pairing Request Phase 1 Pairing Response Pairing over SMP: Phase 2 Legacy pairing or Secure Connections Establishment of encrypted connection with key generated in phase 2 **Key Distribution Key Distribution** Phase 3 **Key Distribution**

1-Concevoir l'authentification:

Vérification des clés stockées .

2-Confidentialité:

Les données ne sont pas lisibles par d'autres utilisateurs .

3-Intégrité : Protection contre l'altération des données .

Sécurité Manager

Sécurité Manager est un module de l'achitecture BLE :

- Protocole et algorithme.
- Génération et échange clés .
- ❖128 Bit de de crypte selon

Standard Avancé de criptage (AES)

- Maitre initialise la sécurité.
- Esclave peut demander la sécurité

- Garantissez la confiance, l'intégrité, la confidentialité et le cryptage des données.
- Responsable de la sécurité
- *Responsable de:
- -Pairing
- -Distribution des clés.
- -Générer des clés à court terme.
